

## Session 6C-2114: How Much Is Another Measurement Worth?

Doug White Emerson Process Management

6/29/2012

#### 6/29/2012

## **Speaker**

#### **Doug White**

**Director, Refining Industry Solutions Senior Principal Consultant PlantWeb Solutions Group Emerson Process Management** 

**Background: Many years experience** designing, justifying, installing and commissioning advanced real time computer/ automation applications in the process industries.

![](_page_1_Picture_9.jpeg)

![](_page_1_Picture_10.jpeg)

## Value of Information on Your Checking Account Balance

![](_page_2_Picture_1.jpeg)

Yesterday – Monthly Report; Manual Updates **Today – Real Time Access** 

![](_page_2_Picture_4.jpeg)

What is the economic value?

- 1. Cost Saving Reduction in overdraft fees, etc
- Revenue Increase Move "reserve" money from low interest checking to higher interest account; Reduced time required allows reallocation to value creation activities
- 3. However more information enables a change but doesn't require it

![](_page_2_Picture_9.jpeg)

## **Typical Process Plant Measurement Upgrade Questions**

![](_page_3_Picture_1.jpeg)

How to economically justify:

- A new flow measurement that has a higher accuracy than the existing one or an additional one where none currently exists
- A new measurement that might identify equipment problems earlier
- A new online analyzer that replaces less frequent lab measurements
- A more accurate temperature measurement in cases where precise temperature control is important

![](_page_3_Picture_7.jpeg)

## **Outline of Paper**

![](_page_4_Picture_1.jpeg)

![](_page_4_Figure_2.jpeg)

![](_page_4_Picture_3.jpeg)

6/29/2012

## **Study Basis**

![](_page_5_Picture_1.jpeg)

In this work it is assumed that there already exists in the plant or proposed plant a minimally sufficient set of measurements to insure safe and stable operation of the plant and to meet all regulatory and fiscal requirements. The focus here is on additional measurements that will increase the plant's financial value.

![](_page_5_Picture_3.jpeg)

# What Are Typical Process Plant Operation of the Son Objectives - The Four Zero's

- Safety the goal is zero serious safety incidents
- Sustainability the goal is zero significant environmental incidents, excess energy use and excess waste
- Reliability the goal is zero unscheduled downtime
- Optimization the goal is <u>zero lost profit</u> opportunities

How Can New Measurements Support These Goals?

![](_page_6_Picture_6.jpeg)

## What is a Plant Decision Cycle?

![](_page_7_Figure_1.jpeg)

![](_page_7_Figure_2.jpeg)

This is the mechanism by which most plant operational 6/29/201 decisions are made – either implicitly or explicitly

#### What are the decision cycles in the plant with a major influence on financial performance?

USERS EXCHANGE

![](_page_8_Figure_1.jpeg)

## **Decision Cycles and Measurements**

![](_page_9_Picture_1.jpeg)

- Process/ Equipment Safety/ Shutdown The highest priority is always assuring the safe operation of equipment and the process itself. Safety shutdown systems often have independent, sometimes redundant, measurements that are intended to detect when plant materials or equipment are in imminent danger of failure and take automatic action to bring the plant to a stable shutdown state.
- Production/ Quality/ Process Control There are multiple measurements and control loops in the plant which are designed to regulate the plant equipment to meet product production rate targets and insure the products are within quality limits in the presence of external and internal disturbances and changing market demands. Additional controls may be in place to optimize energy usage or reactor conditions while meeting these goals.
- <u>Regulatory Reporting</u> there are many regulatory requirements requiring plant measurements and reporting, often including emissions. Failure to provide these values can result in fines or, in the extreme, loss of the plant's operating license.
- Plant/ Equipment Performance Management Production and quality targets cannot be met if required equipment is not available and operating at an acceptable performance level. There are many measurements that are intended to monitor the performance of the equipment to allow early detection of performance deterioration or possible failure and facilitate decisions on when to take maintenance action to correct the deterioration and avoid the failure.
- Financial Management For the plant to maintain profitable operation it is necessary to accurately measure how much was produced (so customers can be properly invoiced) and how much was consumed (raw materials, energy, catalysts, etc.) so appropriate financial performance indicators can be monitored.
- <u>Production Planning/ Scheduling</u> Decisions on the type, quantities and timing of raw materials to purchase and products to produce that optimize profitability depend on accurate measurement of current inventories and current plant/ equipment production limits as well as projected future performance.

# How do we measure plant economic valuation?

![](_page_10_Picture_1.jpeg)

- ROIC = Return on Invested Capital
- ROIC = ATCA / Invested Capital (Start of Year)
  - ATCA = Yearly After Tax Net Income (Tax Adjusted)

![](_page_10_Picture_5.jpeg)

![](_page_11_Figure_0.jpeg)

![](_page_12_Figure_0.jpeg)

## How Can Measurement Improvements Impact Plant ROIC

![](_page_13_Picture_1.jpeg)

- Knowing better what the plant is doing now this implies more accurate measurements with less delay and more frequent measurements of previously difficult to measure conditions.
- Comparing better what the plant is doing against what it is expected to do and understanding the differences – this leads to model based analysis and techniques to better comprehend the information
- Predicting better the effect of alternate decisions in the future

![](_page_13_Picture_5.jpeg)

![](_page_14_Figure_0.jpeg)

## Methodology For Estimating Measurement ROIC

![](_page_15_Picture_1.jpeg)

The recommended methodology for quantifying the financial impact of improved measurements is then to:

- 1. Identify the decision cycles that would be affected by the measurement
- 2. Identify the plant financial variables that are functions of the decision cycles identified
- Estimate the potential increase in profit or reduction in capital that would be obtained through the improved measurement
- 4. Calculate the increased margin and/ or the return on investment

![](_page_15_Picture_7.jpeg)

## **Measurements Provide Options For Improvement**

![](_page_16_Picture_1.jpeg)

- Improved measurement provides the <u>option</u> to improve decisions but does not guarantee implementation – it is a necessary but not a sufficient condition
- Need to calculate a probability that the information will be used to actually improve the decision cycle based on its mechanics and use this probability to calculate an expected value of the improvement
- This consideration seems often to be missed in other references on this subject

![](_page_16_Picture_5.jpeg)

![](_page_17_Picture_0.jpeg)

## **Case Study 1**

#### How To Justify Improved Flow Measurements

#### **Example: Leak Detection**

![](_page_17_Picture_4.jpeg)

## **Value of Reducing Uncertainty**

![](_page_18_Picture_1.jpeg)

Measurement Value Probability Density Function

![](_page_18_Figure_3.jpeg)

#### What is the value of reduced uncertainty?

![](_page_18_Picture_5.jpeg)

## **Case Study – Improved Measurement Accuracy**

![](_page_19_Picture_1.jpeg)

![](_page_19_Figure_2.jpeg)

Reducing "Value at Risk"; Minimum Unmeasured Flow Value That Is Statistically Indeterminate

Decision Cycle Impact: Plant Performance Monitoring – could be others as well

![](_page_19_Picture_5.jpeg)

## **Measurement Terminology**

![](_page_20_Picture_1.jpeg)

- Repeatability The ability of a measuring device to give the same result at the same process conditions
  - Usually taken at two times the sample standard deviation observed (95% confidence level)
- Accuracy The closeness of agreement between the result of the measurement and the true value
  - Errors can be random or biased
  - Often expressed over a range of process conditions
  - Can be measured only under test conditions
  - Usually taken at two times the standard deviation calculated or observed (95% confidence level)
- Uncertainty An expression that represents the dispersion of values that could reasonably be expected under the conditions of measurement
  - Usually expressed as standard deviation

6/29/2012

## **Value of Improved Accuracy**

![](_page_21_Picture_1.jpeg)

Possible Leak Investigation								
	Original Flow Readings	Flow, Mass Balanced Converged	Absolute Difference	Flow Measurement Uncertainty, 3% Accuracy	Flow Measurement Uncertainty, 1% Accuracy			
				0.03	0.01			
Stream 1	45	44.43	0.57	1.35	0.45			
Stream 2	55	54.15	0.85	1.65	0.55			
Stream 3	96	98.58	2.58	2.88	0.96			
Conclusion				No Result	Leak Likely			

Increasing Flow Accuracy Permits Identification of Possible Leak

![](_page_21_Picture_4.jpeg)

## **Leak Estimate**

![](_page_22_Picture_1.jpeg)

Plausible Leak Estimate								
	Original Flow Readings	Flow, Mass Balanced Converged	Absolute Difference	Flow Measurement Uncertainty, 1% Accuracy				
Stream 1	45	44.81	0.19	0.45				
Stream 2	55	54.71	0.29	0.55				
Stream 3	96	96.88	0.88	0.96				
Stream 4								
(Leak)	0	2.64	2.64					

Value At Risk = 2.64 x value per production unit x time scale of interest

![](_page_22_Picture_4.jpeg)

![](_page_23_Picture_0.jpeg)

## Case Study 2

#### How To Justify New Measurements to Identify Potential Reliability Issues

#### **Example: Improving Pump Performance**

![](_page_23_Picture_4.jpeg)

![](_page_24_Picture_0.jpeg)

![](_page_24_Picture_1.jpeg)

**Decision Cycle Impact:** 

## Plant/ Equipment Performance Management – could be others as well

![](_page_24_Picture_4.jpeg)

![](_page_25_Picture_0.jpeg)

## Financial Impact Areas For Improved Equip

#### **Reductions in:**

- Unscheduled Shutdowns
  - Lost Unit Production Value (when production limited)
  - Direct Cost Unscheduled Shutdown (non serious incident related)
    - Off spec (slop) product reprocessing, flared material loss, catalyst loss/ deterioration, critical equipment damage, unscheduled maintenance labor (fully burdened)/ unscheduled cranes/ heavy equipment, equipment replacement, cleanup, operating staff overtime
  - Serious incident cost (fire, major/ reportable environmental release, shelter in place, injury/ death)
    - External compensatory and cleanup payments
    - Reporting Costs
    - Fines
- Unit Upset
  - Lost Unit Production Value (when production limited)
  - Direct Cost Unit Upset
    - Off spec (slop) product reprocessing, flared material loss, catalyst loss/ deterioration, critical equipment damage, unscheduled maintenance labor (fully burdened), equipment replacement, cleanup, operating staff overtime
- Unscheduled Slowdowns
  - Lost Unit Production Value (when production limited)
- Routine Maintenance
  - Ongoing Maintenance
  - Turnaround Maintenance
- Manual Equipment Readings (Reduced Personnel Exposure)

#### Return on Investment Summary – Monitoring on 10 Pumps

![](_page_30_Picture_1.jpeg)

Benefit Summary - 10 Pumps	
	\$/ year
Reduced Unscheduled Shutdowns/ Slowdowns	
Increased Availability (Crude + Vacuum)	33000
Reduced Direct Cost, Unscheduled Shutdown	9000
Reduced Serious Incidents Cost, Unscheduled Shutdowns	18000
Reduced Routine Maintenance	30000
Reduced Turnaround Mintenance	6000
Total	96000
Investment 10 Pumps	155000
Simple Payback, Years	1.6

![](_page_30_Picture_3.jpeg)

## Summary

![](_page_31_Picture_1.jpeg)

- Determining the financial justification for additional measurements in existing or new proposed process plants is a common issue.
- Measurements have to improve decisions (including control loop decisions) to have value
- Typical plant decision cycles and plant economic valuation models can be used to calculate the expected return on investment

![](_page_31_Picture_5.jpeg)
